

Greenspace Herbs unveils revolutionary Quantum Ayurveda technology platform

11 August 2025 | News

The first successful commercialisation of quantum-enhanced botanical supplements

Greenspace Herbs, a Bengaluru-based botanical ingredients company, has announced the commercial launch of Quantum Ayurveda, a groundbreaking technology platform that enhances traditional herbal ingredients using quantum resonance principles.

The innovation represents the first successful commercialisation of quantum-enhanced botanical supplements, bridging ancient Ayurvedic wisdom with cutting-edge scientific methodology.

The Quantum Ayurveda platform uses its own "resonance loading" and "lattice locking" technology to make traditional Ayurvedic plants more bioavailable and easier to administer to specific areas. The business has successfully mapped 25,000 bioactive signatures and is currently working on 150,000 more.

The technology has already gained attention from international trade publications and is being evaluated by major supplement manufacturers in the United States and Europe.

The Quantum Ayurveda platform development involved collaboration with researchers from diverse scientific disciplines, including aerospace engineering and space health programs. While some collaborators have professional experience with organisations like NASA, the company emphasises that no space agency endorses or is affiliated with these products.

All ingredients undergo extensive third-party testing for chemistry, microbiology, and stability. The company is initiating observational studies to evaluate safety profiles and functional benefits, with results intended for peer review publication.

All Quantum Ayurveda ingredients are classified as dietary supplements intended to support normal physiological function and general well-being. The products are not intended to diagnose, treat, cure, or prevent any disease.
