

Siemens Healthineers announces expansion of manufacturing footprint in India

07 April 2026 | News

Addressing the surging demand for advanced therapies amid rising heart ailments with Artis one Edition X angiography system

Siemens Healthineers has announced the expansion of manufacturing footprint in India with the local production of the Artis one Edition X angiography system at company's Bengaluru factory.

The system will be manufactured alongside the facility's existing portfolio of mobile C-arms, CT scanners, MRI systems, and digital radiography X-ray systems, further strengthening the company's commitment to the Make in India initiative and to advancing access to innovative healthcare technologies across the country.

With its advanced capabilities, Artis One Edition X empowers clinicians with enhanced imaging and workflow efficiency while supporting improved patient outcomes. It helps interventionalists perform procedures that restore blood flow and treat blockages in arteries and veins, thereby benefitting patients with conditions such as heart disease, kidney failure, and irregular heart rhythms.

Additionally, India's cath lab density currently stands at just 1.5 to 1.75 per million people, underscoring the urgent need for accessible cardiac care infrastructure. This growing demand is evident in the widespread adoption of angiography systems across metropolitan hubs and tier 2/3 cities.

Designed as a compact, low-maintenance, and versatile solution, Artis One Edition X enables healthcare providers to treat a greater number of patients efficiently while maintaining high clinical standards. The universal angiography system combines

flexibility with advanced imaging features, making it the need of the hour for hospitals and healthcare providers looking to expand their interventional capabilities.
